

# Public GitHub analysis

Current data overview — declared-attribution, not proof of origin

Declared attribution is evidence of an explicit declaration under the named rule version; it is not proof of code origin.

|                                                |                                |
|------------------------------------------------|--------------------------------|
| Report generated (UTC)<br>2026-10-04T04:34:27Z | Repository-panel coverage<br>3 |
| Observed event sources<br>11                   |                                |

Panel population: configured-panel snapshot.

Panel source data time (UTC): 2026-10-04T04:34:22Z.

Observed event window (UTC): 2025-02-01T00:00:00Z through 2026-10-03T01:00:00Z .

## Declared-attribution summary

|                                  |                            |                    |
|----------------------------------|----------------------------|--------------------|
| Explicitly AI-assisted<br>0      | Explicitly human-only<br>0 | Indeterminate<br>2 |
| Bot commit facts (separate)<br>0 |                            |                    |

Primary denominator: 2 non-bot unique observed commit facts. Missing declaration is indeterminate, not evidence of human work.

## Trend from observed event data

Monthly rows cover only observed source windows within the last ten years. Missing months are not zeroes and do not imply missing GitHub activity.

| Month (UTC) | AI-assisted | Human-only | Indeterminate | Bots | Non-bot total |
|-------------|-------------|------------|---------------|------|---------------|
| 2025-02     | 0           | 0          | 2             | 0    | 2             |

## Repository-panel language bytes

These are GitHub language bytes, not lines of code. Both distributions use the identical measured panel population. 0 repository/repositories with no measured code are excluded from both denominators.

| Language   | Equal-repository share | Byte-weighted share | Aggregate language bytes |
|------------|------------------------|---------------------|--------------------------|
| CSS        | 0.00%                  | 0.00%               | 18                       |
| Dockerfile | 0.05%                  | 0.12%               | 7337                     |
| HTML       | 0.05%                  | 0.08%               | 4858                     |
| JavaScript | 0.05%                  | 0.13%               | 7582                     |
| Makefile   | 0.21%                  | 0.04%               | 2527                     |
| Python     | 66.42%                 | 16.14%              | 955863                   |
| SCSS       | 1.10%                  | 2.76%               | 163450                   |
| Shell      | 0.10%                  | 0.22%               | 12871                    |
| TypeScript | 32.02%                 | 80.51%              | 4769619                  |

Measured repositories: 3; total measured language bytes: 5924125.

## Methodology and limits

The primary category is declared-attribution: an explicit versioned declaration is recognized, but it is never proof that a human or tool originated code. Multiple valid tool labels still count once in the primary AI-assisted category.

- GitHub Search API has a 1,000-result cap and rate limits; it cannot establish an authoritative global repository census.
- GH Archive is an observed public event stream. PushEvent payload commit objects are not a complete commit census and are not equivalent to pushes.
- Public historical datasets and API metadata are bounded or stale populations, not a complete history.
- Selection frame bias.
- Source availability and api-rate-limit bias.
- Survivorship bias.
- Time-of-day sampling bias for scheduled event collection.
- Declaration and tool-reporting bias.
- Data gap: Only successfully ingested event source windows are represented; unobserved hours and months are not zero activity.
- Data gap: PushEvent payload commit objects omit commit history outside the observed public event stream.
- Data gap: Repository language data excludes repositories with empty or unavailable GitHub language measurements from language-share denominators.
- Data gap: No source failure has been recorded in the current state.

## Sources and coverage

The exact source identifiers, timestamps, UTC windows, status, and source digests are included in [the machine-readable report manifest](#).

| Kind/status                  | Source                                                                                                        | Observed (UTC)       | UTC window                                  | Accepted records |
