Public GitHub analysis

Current data overview — declared-attribution, not proof of origin

Declared attribution is evidence of an explicit declaration under the named rule version; it is not proof of code origin.

Report generated (UTC)	Repository-panel coverage
2026-10-13T03:40:28Z	3

Observed event sources
20

Panel population: configured-panel snapshot.

Panel source data time (UTC): 2026-10-13T03:40:23Z.

Observed event window (UTC): 2025-02-01T00:00:00Z through 2026-10-12T01:00:00Z .

Declared-attribution summary

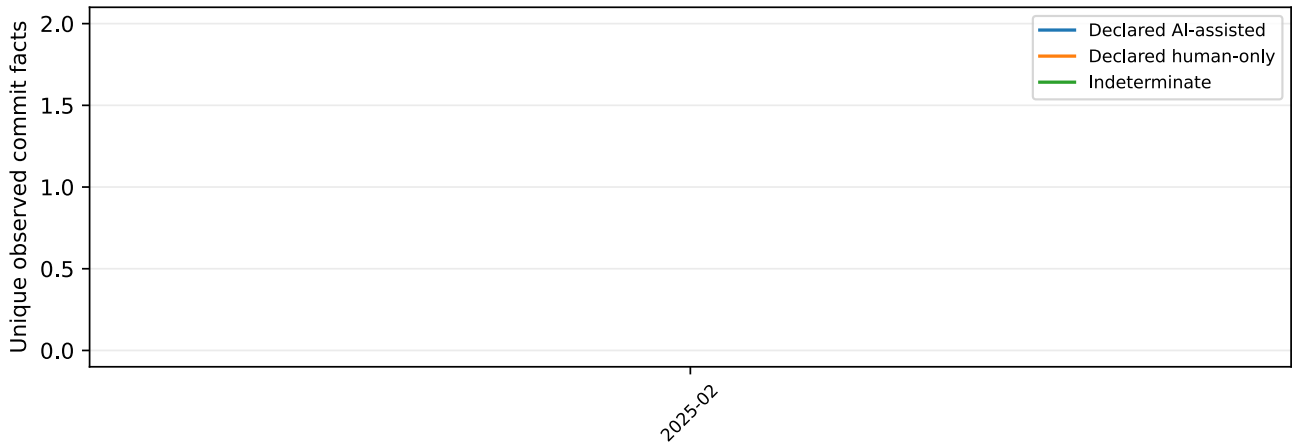
Explicitly AI-assisted	Explicitly human-only	Indeterminate
0	0	2

Bot commit facts (separate)
0

Primary denominator: 2 non-bot unique observed commit facts. Missing declaration is indeterminate, not evidence of human work.

Trend from observed event data

Monthly rows cover only observed source windows within the last ten years. Missing months are not zeroes and do not imply missing GitHub activity.



Month (UTC)	AI-assisted	Human-only	Indeterminate	Bots	Non-bot total
2025-02	0	0	2	0	2

Repository-panel language bytes

These are GitHub language bytes, not lines of code. Both distributions use the identical measured panel population. 0 repository/repositories with no measured code are excluded from both denominators.

Language	Equal-repository share	Byte-weighted share	Aggregate language bytes
CSS	0.00%	0.00%	18
Dockerfile	0.03%	0.08%	4592
HTML	0.05%	0.08%	4858
JavaScript	0.05%	0.13%	7582
Makefile	0.21%	0.04%	2527
Python	66.42%	16.12%	955210
SCSS	1.12%	2.81%	166787
Shell	0.10%	0.22%	13027
TypeScript	32.02%	80.52%	4771799

Measured repositories: 3; total measured language bytes: 5926400.

Methodology and limits

The primary category is declared-attribution: an explicit versioned declaration is recognized, but it is never proof that a human or tool originated code. Multiple valid tool labels still count once in the primary AI-assisted category.

- GitHub Search API has a 1,000-result cap and rate limits; it cannot establish an authoritative global repository census.
- GH Archive is an observed public event stream. PushEvent payload commit objects are not a complete commit census and are not equivalent to pushes.
- Public historical datasets and API metadata are bounded or stale populations, not a complete history.
- Selection frame bias.
- Source availability and api-rate-limit bias.
- Survivorship bias.
- Time-of-day sampling bias for scheduled event collection.
- Declaration and tool-reporting bias.
- Data gap: Only successfully ingested event source windows are represented; unobserved hours and months are not zero activity.
- Data gap: PushEvent payload commit objects omit commit history outside the observed public event stream.
- Data gap: Repository language data excludes repositories with empty or unavailable GitHub language measurements from language-share denominators.
- Data gap: No source failure has been recorded in the current state.

Sources and coverage

The exact source identifiers, timestamps, UTC windows, status, and source digests are included in the machine-readable report manifest.
